Bucharest, Romania

# Which was the purpose of our contribution?

**Continuous monitoring** of heavy metals content in vegetal products **is a priority** for food control and a risk assessment strategy for human health.

**Why is this action a priority**

harmful to the health of general public

**Heavy metals**

cumulative poisons

neurologic, behavioral,  
hematologic **disorders**

cardiovascular  
**diseases**

**cancers**

**mechanism** by which it produces  
tumors in humans **is not completely  
understood**

- pulmonary and gastrointestinal **irritant** → **can be fatal if inhaled or ingested;**
- affects reproduction in mammals;
- can affect the skeletal system → skeletal demineralization → **Itai-itai disease**

- the most vulnerable target of lead poisoning is **nervous system**;
- for **adults**: reproductive effects, brain damage, kidney damage;
- for **children**: lower IQ, decreased ability to pay attention and underperformance at school.

**Which chemical elements are  
considered *heavy metals*?**

**Duffus (2002):** Chemical elements defined as "*heavy metals*" has density between 3.5-7 g/cm<sup>3</sup>.

**Appenroth (2010):** "*heavy metals*" are represented by metals and some metalloids that are framed in three groups.

Actinides:

In our contribution, the term "*heavy metals*" is used from environmental point of view and is related to their effects on human health.

# Which are the environmental sources of heavy metals?

**agriculture**  
(fertilizers and pesticides)

phosphate fertilizer

Cd, As, Pb, Cr, Hg, Ni, V –  
variable levels depending of the  
phosphate rocks sources

**natural causes**  
(volcanic activity,  
soil erosion, etc)

**Heavy  
metals  
sources**

**industrial  
activities**

**atmospheric  
deposition**

**preservation practices**  
of vegetal samples

**irrigation with  
wastewater**

# What about legislation?

## Regulation (EC) No 1881/2006

**Table 1.** Maximum admitted levels for lead and cadmium in vegetal products and provisional tolerable weekly intake (PTWI)

| Heavy metal                                | Foodstuffs  | Maximum level (mg/kg fresh weight) |
|--|---|------------------------------------|
| <b>Lead (Pb)</b>                           | Cereals, legumes and pulses   | 0.20                               |
|  | Vegetables, excluding brassica vegetables, leaf vegetables, fresh herbs and fungi. For potatoes the maximum level applies to peeled potatoes. | 0.10                               |
|  | Brassica vegetables, leaf vegetables and cultivated fungi   | 0.30                               |
|  | Fruit, excluding berries and small fruit  | 0.10                               |
|  | Berries and small fruit   | 0.20                               |
| <b>PTWI for lead, mg/kg body weight</b>    |   | 0.025                              |
| <b>Cadmium (Cd)</b>                        | Cereals excluding bran, germ, wheat and rice  | 0.10                               |
|  | Bran, germ, wheat and rice  | 0.20                               |
|  | Soybeans  | 0.20                               |
|  | Vegetables and fruit, excluding leaf vegetables, fresh herbs, fungi, stem vegetables, pine nuts, root vegetables and potatoes                 | 0.050                              |
|  | Leaf vegetables, fresh herbs, cultivated fungi and celeriac   | 0.20                               |
|  | Stem vegetables, root vegetables and potatoes, excluding celeriac. For potatoes the maximum level applies to peeled potatoes.                 | 0.10                               |
| <b>PTWI for cadmium, mg/kg body weight</b> |   | 0.007                              |

# Heavy metals accumulation in vegetal products

**Elevated levels** of heavy metals produce:

a) *physiological changes in plants*:

- inhibit the ability of the plant to synthesize chlorophyll;
- high oxidative stress;
- suppression of plant growth;

b) *modification of biochemical parameters*:

- increase of sugar, phenol and ascorbic acid contents;
- decline of protein soluble levels.

**Two  
perspectives**

Related to **negative effects** on consumers' health:

- chronic diseases
- disturbances at central nervous system level
- renal dysfunctions

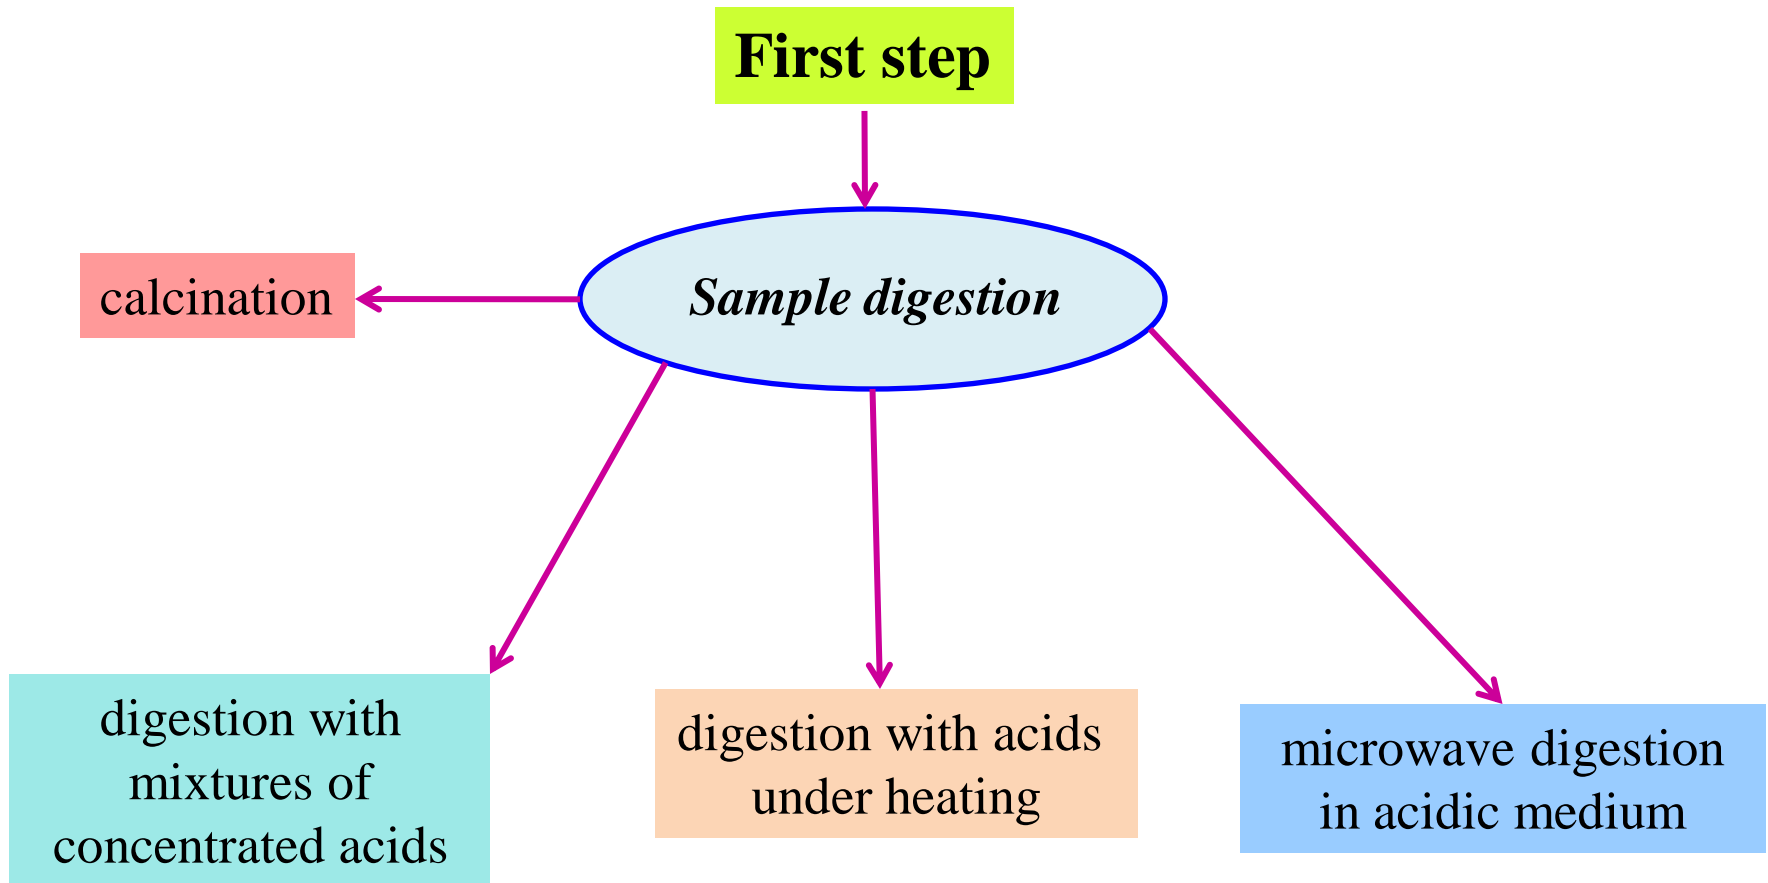

Different studies demonstrated that arsenic, lead and cadmium:

- were **highly enriched in leafy vegetables** and barely accumulated in fruit vegetables;
- the levels in leafy vegetables were **three times higher** than those in non-leafy vegetables;
- the ability of vegetables to uptake and accumulate follows variation: leafy vegetables>stalk vegetables>root vegetables.

# Overview of procedures used for heavy metals determination by **AAS technique** (*selection of literature data*)

| Sample  | Metals                     | Digestion   | Analytical technique            |
|---|----------------------------|---|---------------------------------|
| fruits, vegetables                              | Cd, Pb                     | samples are dried at 105°C and <b>calcinated</b> at 450°C; residue was treated with 5 mL <b>HNO<sub>3</sub> 65%</b> and heated on a sand bath at 150°C                            | FAAS                            |
| leafy and fruit vegetables                      | Pb, Cd, Fe, Zn, Cu         | 10 g sample + 10 mL <b>HNO<sub>3</sub> conc.</b> , digestion at 90°C for 45 minutes and at 130°C for 3 hours  | FAAS                            |
| leafy, fruit and root vegetables                | Mn, Fe, Cu, Zn, Pb, Cd     | 1 g dry sample + 15 mL triacid mixture ( <b>HNO<sub>3</sub> 70%, HClO<sub>4</sub> 65%, H<sub>2</sub>SO<sub>4</sub> 70%</b> , 5:1:1) + digestion at 80°C                           | FAAS                            |
| legumes, leafy vegetables, stems, roots, fruits | Fe, Mn, Cu, Zn, Pb, Cd, Hg | drying at 100°C, grinding 1 g dry sample + 15 mL triacid mixture ( <b>HNO<sub>3</sub> 65%, HClO<sub>4</sub> 65%, H<sub>2</sub>SO<sub>4</sub> 70%</b> , 5:1:1) + digestion at 80°C | ETAAS<br>HGAAS                  |
| vegetables                                      | Ni, Zn, Cu                 | sample is oven-dried at 105°C for 24 hours; 3 g dried sample <b>dry-ashed</b> 3 hours at 450°C; ash is treated with 10 mL <b>HNO<sub>3</sub> conc.</b>                            | FAAS                            |
| vegetables                                      | Cd, Pb, Ni, Co, Cr         | drying at 65°C; 1 g sample was digested in Pyrex tubes with <b>HNO<sub>3</sub>:HClO<sub>4</sub> = 3:1</b>   | FAAS                            |
| vegetables                                      | Cu, Zn, Pb, Cd             | 10 g sample is dried at 105°C, then is <b>calcinated</b> at 450°C; the ash is treated with 5 mL <b>HClO<sub>4</sub></b> and 10 mL <b>HNO<sub>3</sub></b>                          | FAAS (Cu, Zn)<br>GFAAS (Cd, Pb) |

# Overview of procedures used for heavy metals determination by **ICP-MS technique** (*selection of literature data*)

| Sample                                     | Metals                               | Digestion   |
|--|--------------------------------------|---|
| apple, carrots                             | Cd, Pb, Cu, Zn                       | digestion at 200°C with 8 mL $\text{HNO}_3$ and 2 mL $\text{H}_2\text{O}_2$   |
| corn, mint, eggplant, pepper, tomato       | Cd, Co, Cr, Cu, Mo, Ni, Pb, Zn       | 0.5 g sample digested with $\text{HNO}_3$ conc. and the resulted residue treated with aqua regia  |
| fruits, vegetables                         | Pb, Cd, Hg, V, Cr                    | 1 g sample was treated with 5 mL $\text{HNO}_3$ 69% and 1 mL $\text{H}_2\text{O}_2$ 30%, microwave digested   |
| fruits, vegetables, nuts                   | Co, Cr, Cu, Mn, Mo, Ni, Sr, Tl, U, V | 2 g sample is treated with 6 mL $\text{HNO}_3$ 68% and 2 mL $\text{H}_2\text{O}_2$ 30%; microwave assisted digestion  |
| vegetables                                 | Pb, Zn, Cd, Cu                       | 0.5 g dried sample microwave digested with 5 mL $\text{HNO}_3$ conc., heated at 100°C for 30 minutes; after cooling was added 2 mL $\text{H}_2\text{O}_2$ and microwave digested for other 21 minutes |
| vegetables (fruits, leaves, tubers, bulbs) | As, Cd, Pb                           | microwave digestion with $\text{HNO}_3$ 65% and $\text{H}_2\text{O}_2$ 30%  |

# Overview of procedures used for heavy metals determination by **ICP-OES technique** (*selection of literature data*)

| Sample                                    | Metals   | Digestion   |
|---|--|---|
| cereals, pulses, tuber, nuts, dried fruit | Cd, Cr, Cu, Pb                                 | 0.25 g dried sample treated with 5 mL <b>HNO<sub>3</sub> conc.</b> ; after an hour was <b>microwave digested</b>  |
| endive                                    | Cd, Co, Cr, Cu, Fe, Mn, Mo, Ni, Pb, Zn         | 0.5 g dried plant was <b>microwave digested</b> with 2 mL <b>HNO<sub>3</sub> conc.</b> and 2 mL <b>H<sub>2</sub>O<sub>2</sub></b>   |
| fruit juices                              | Cr, Cd, Pb                                     | 0.5 mL sample is treated with 5 mL <b>HNO<sub>3</sub> 69.5%</b> , 2 mL <b>H<sub>2</sub>O<sub>2</sub> 35%</b> and heated in oven at 200°C for 20 minutes, close to dryness |
| fruits                                    | As, Cd, Co, Cr, Cu, Hg, Ni, Pb, Sb, Se, Tl, Zn | 0.5 g sample treated with 15 mL <b>HNO<sub>3</sub></b> and 5 mL <b>H<sub>2</sub>O<sub>2</sub></b> , left overnight; digestion 2 hours at 130°C                            |
| fruits                                    | As, Cd, Pb                                     | 0.5 g of dried and ground sample was <b>microwave digested</b> using 6 mL <b>HNO<sub>3</sub> 65%</b> , 2 mL <b>H<sub>2</sub>O<sub>2</sub> 30%</b>                         |
| lettuce, broad bean                       | Cd, Pb   | samples are dried at 70°C; digestion by wet oxidation with <b>HNO<sub>3</sub> conc.</b> under pressure in a microwave oven  |
| medicinal plant species                   | As, Cd, Co, Cr, Ni, Pb                         | plants were fried at 105°C, grounded, digested with <b>HNO<sub>3</sub></b> and <b>H<sub>2</sub>O<sub>2</sub></b>  |
| perennial plants                          | As, Cd, Pb                                     | 1 g plant sample is wet digested with 16 mL mixture <b>HNO<sub>3</sub></b> and <b>H<sub>2</sub>O<sub>2</sub> (6:2)</b> on a hot plate                                     |

# Conclusions

**Heavy metals monitoring** in vegetal products, especially in those destined for human consumption **is a priority for food control**, therefore, *selection of the most appropriate method of analysis to obtain accurate results is a must.*

For quantification of heavy metals in plants, *literature studies present a large range of analytical techniques*, the most used of them being addressed in this paper.

Selection of one technique or other must be correlated with type of sample, the metal of interest and its' concentration in the sample, time of analysis, the financial possibilities of the laboratory.

*It is important to evaluate advantages and disadvantages of each method* and to document before each analysis, moreover some available analysis protocols depicted in literature must be amended and adapted to the subjected sample to analysis.

## ACKNOWLEDGEMENTS

This work is consistent with research directions and guidelines specified by Ministry of Agriculture and Rural Development in project ADER 1.4.4. *Identification, evaluation, testing, development and validation of analysis methods of nutrients and contaminants from inputs usable in organic agriculture.*

The authors of this contribution thank you for
